

A FLOATING-POINT NUMBERS THEORY FOR EVENT-B

The LMF Lab Seminar

m Domaine Saint Paul, Saint-Rémy-lès-Chevreuse - June 13-14, 2024

OUTLINE

- The context of the work
- The motivating example
- The proposed approach
- Revisiting the motivating example
- Conclusion and future works

Back to the begin - Back to the outline

OUTLINE

- The context of the work
- ◆ The motivating example
- The proposed approach
- Revisiting the motivating example
- Conclusion and future works

Back to the begin - Back to the outline

- The Event-B method is an evolution of the classical B method.
 - modelling a system by a set of events instead of operations.

- The Event-B method is an evolution of the classical B method.
 - modelling a system by a set of events instead of operations.
- The Event-B method is a formal method based on first-order logic and set theory.

- The Event-B method is an evolution of the classical B method.
 - modelling a system by a set of events instead of operations.
- The Event-B method is a formal method based on first-order logic and set theory.
- The Event-B method is based on:
 - the notions of pre-conditions and post-conditions (Hoare),
 - the weakest pre-condition (Dijkstra),
 - and the calculus of substitution (Abrial).

USING EVENT-B METHOD

- The use of the **Event-B method** has continued to increase.
 - applied to various applications and domains.
 - railway, automotive, aeronautics, cybersecurity, nuclear-energy, ...

USING EVENT-B METHOD

- The use of the **Event-B method** has continued to increase.
 - applied to various applications and domains.
 - railway, automotive, aeronautics, cybersecurity, nuclear-energy, ...
- The Event-B method is adapted to analyse discrete systems.
 - offers the possibility of modelling discrete behaviours.

THE THEORY PLUGIN

• Theory Plug-in provides capabilities to extend the Event-B mathematical language and the Rodin proving infrastructure.

THE THEORY PLUGIN

- Theory Plug-in provides capabilities to extend the Event-B mathematical language and the Rodin proving infrastructure.
- An Event-B theory can contain :
 - new datatype definitions,
 - new polymorphic operator definitions,
 - axiomatic definitions,
 - theorems,
 - associated rewrite and inference rules.

OUTLINE

- The context of the work
- The motivating example
- The proposed approach
- Revisiting the motivating example
- Conclusion and future works

Back to the begin - Back to the outline

• System that continuously calculates a moving object's speed.

- System that continuously calculates a moving object's speed.
- Analysing two functional properties :

- System that continuously calculates a moving object's speed.
- Analysing two functional properties :
 - PROP-1: the speed of the moving object is equal to the $travaled_distance$ divided by the $measured_time$ (v = d/t).

- System that continuously calculates a moving object's speed.
- Analysing two functional properties :
 - PROP-1: the speed of the moving object is equal to the $travaled_distance$ divided by the $measured_time$ (v = d/t).
 - PROP-2: when the *travaled_distance* is strictly positive, the *speed* of the moving object must also be strictly positive.
 - the object moves when its *speed* is different from zero.

- System that continuously calculates a moving object's speed.
- Analysing two functional properties :
 - PROP-1: the speed of the moving object is equal to the $travaled_distance$ divided by the $measured_time$ (v = d/t).
 - PROP-2: when the *travaled_distance* is strictly positive, the *speed* of the moving object must also be strictly positive.
 - the object moves when its *speed* is different from zero.

Objectives → showing some modelling and validation problems :

- analysing physical phenomena.
 - expressions that come from the physics laws.
- using integer variables to handle small values.

- System that continuously calculates a moving object's speed.
- Analysing two functional properties :
 - PROP-1: the speed of the moving object is equal to the $travaled_distance$ divided by the $measured_time$ (v = d/t).
 - PROP-2: when the travaled_distance is strictly positive, the speed of the moving object must also be strictly positive.
 - the object moves when its *speed* is different from zero.

```
MACHINE mch_integer_version ... INVARIANTS

EVENTS
get_speed ≘
  any p t
  where
    @grd1: p \in \mathbb{N}_1 \land p > starting_position
    @ard2: t \in \mathbb{N}_1 \wedge t > starting\_time
  then
    @act1: traveled\_distance := p - starting\_position
    @act2: measured_time := t - starting_time
    @act3: speed := (p - starting_position) \div (t - starting_time)
  end
END
```

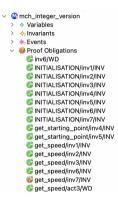

GENERATED AND PROVEN POS

 All POs are green except the one maintaining the @inv7 invariant by the get_speed event.

GENERATED AND PROVEN POS

- All POs are green except the one maintaining the @inv7 invariant by the get_speed event.
- This invariant formalises the PROP 2 property.
 - the object moves ($traveled_distance \neq 0$) when $speed \neq 0$.

GENERATED AND PROVEN POS

- All POs are green except the one maintaining the @inv7 invariant by the get_speed event.
- This invariant formalises the PROP 2 property.
 - the object moves ($traveled_distance \neq 0$) when $speed \neq 0$.
- The <u>get_speed</u> event calculates the new value of <u>traveled_distance</u> that can be < the new value of <u>measured_time</u>.
 - the new value of speed($traveled_distance \div measured_time$) can be = 0 while $traveled_distance \ne 0$
 - + makes an integer division

CONCLUSION

The basic types and operators of the Event-B language are not adapted to our needs

OUTLINE

- The context of the work
- ◆ The motivating example
- The proposed approach
- Revisiting the motivating example
- Conclusion and future works

Back to the begin - Back to the outline

FLOATING-POINT NUMBERS

 $x = 3.14159265359 = \underbrace{314159265359}_{\text{significand}} \times \underbrace{10}_{\text{base}}^{\text{exponent}}$

FLOATING-POINT NUMBERS

$$x = 3.14159265359 = \underbrace{314159265359}_{\text{significand}} \times \underbrace{10}_{\text{base}}^{\text{exponent}}$$

We have chosen that the base always equals ten in our models.

$$x = s(x) \times 10^{e(x)}$$

FLOATING-POINT NUMBERS

$$x = 3.14159265359 = \underbrace{314159265359}_{\text{significand}} \times \underbrace{10}_{\text{base}}^{\text{exponent}}$$

We have chosen that the base always equals ten in our models.

$$x = s(x) \times 10^{e(x)}$$

- The proposed theory does not model limited precision.
- The operators defined in the theory involve no precision loss.

• To allow the **Event-B language** to embed this **FP representation**, we need to define two theories:

- To allow the **Event-B language** to embed this **FP representation**, we need to define two theories:
 - 1. the first one formalises the power operator.

- To allow the Event-B language to embed this FP representation, we need to define two theories:
 - 1. the first one formalises the power operator.
 - operator is not implemented in the automated proofs besides ^0 and ^1.

- To allow the Event-B language to embed this FP representation, we need to define two theories:
 - 1. the first one formalises the power operator.
 - operator is not implemented in the automated proofs besides ^0 and ^1.
 - 2. the second one formalises floating-point numbers by specifying:
 - the corresponding data type,
 - the supported arithmetic operators,
 - some axioms and theorems that characterise the proposed modelling.

THE POWER OPERATOR

```
THEORY thy_power_operator
AXIOMATIC DEFINITIONS
  operators
    pow(x \in \mathbb{Z}, n \in \mathbb{N}) : \mathbb{Z} INFIX // x pow n = x^n
    wd condition : \neg (x = 0 \land n = 0) // 00 is not defined
END
```

THE POWER OPERATOR

```
THEORY thy power operator
AXTOMATTC DEFINITIONS
  operators
     pow(x \in \mathbb{Z}, n \in \mathbb{N}) : \mathbb{Z} INFIX // x pow n = x^n
     wd condition: \neg (x = 0 \land n = 0) // 0^0 is not defined
  axioms
     @axm1: \forall n · n \in \mathbb{N}_1 \Rightarrow 0 pow n = 0
      @axm2: \forall x \cdot x \in \mathbb{Z} \land x \neq \emptyset \Rightarrow x \text{ pow } \emptyset = 1
      @axm3: \forall x,n \cdot x \in Z \wedge x \neq 0 \wedge n \in \mathbb{N}_1 \Rightarrow x pow n = x \times (x pow (n - 1))
END
```

THE POWER OPERATOR

```
THEORY thy power operator
AXTOMATTC DEFINITIONS
   operators
      pow(x \in \mathbb{Z}, n \in \mathbb{N}) : \mathbb{Z} INFIX // x pow n = x^n
      wd condition: \neg (x = \emptyset \land n = \emptyset) // \emptyset^0 is not defined
   axioms
      @axm1: \forall n · n \in N<sub>1</sub> \Rightarrow 0 pow n = 0
      @axm2: \forall x \cdot x \in \mathbb{Z} \land x \neq \emptyset \Rightarrow x pow \emptyset = 1
      @qxm3: \forall x.n · x \in \mathbb{Z} \wedge x \neq 0 \wedge n \in \mathbb{N}_1 \Rightarrow x pow n = x \times (x pow (n - 1))
THEOREMS
   \emptysetthm1: \forall x,n,m \cdot ... \Rightarrow x pow (n + m) = (x pow n) \times (x pow m)
  @thm2: \forall x.n.m \cdot ... \Rightarrow (x pow n) pow m = x pow (n \times m)
   @thm3: \forall x,y,n \cdot ... \Rightarrow (x \times y) \text{ pow } n = (x \text{ pow } n) \times (y \text{ pow } n)
   . . .
END
```

By using this theory, it becomes possible to prove, for example, that
 5 pow 3 = 125

- By using this theory, it becomes possible to prove, for example, that
 5 pow 3 = 125
- The proofs of all theorems were made by induction (following the rules defined by Cervelle and Gervais - ABZ 2023).

- By using this theory, it becomes possible to prove, for example, that
 5 pow 3 = 125
- The proofs of all theorems were made by induction (following the rules defined by Cervelle and Gervais - ABZ 2023).
- We have chosen to define the pow operator in a single theory to offer the possibility of reusing it in other Event-B components.

 - \times ex. we cannot precisely represent the result of 1/3 or 2/3
- For the case of inv and div operators, we have defined the Well-definedness conditions.
 - To calculate inv(x), we must find a z, with $10^n = z \times s(x)$.
 - $\checkmark inv(2.5) = 1/2.5 = 0.4 = 4 \times 10^{-1} (z = 4 \text{ because } 100 = 4 \times 25)$
 - $\times inv(3) = 1/3 = 0.3333...$ (z does not exist)

- The proposed theory involves no precision loss for plus and mult operators.
- The division sometimes induces a precision loss.
 - \times ex. we cannot precisely represent the result of 1/3 or 2/3
- For the case of inv and div operators, we have defined the Well-definedness conditions.
 - To calculate inv(x), we must find a z, with $10^n = z \times s(x)$.
 - $vinv(2.5) = 1/2.5 = 0.4 = 4 \times 10^{-1}$ (z = 4 because $100 = 4 \times 25$)
 - varphi inv(3) = 1/3 = 0.3333... (z does not exist)
 - To calculate x div y, we must find a z, with $10^n \times s(x) = z \times s(y)$.
 - ✓ 2 $div \ 5 = 2/5 = 0.4 = 4 \times 10^{-1} \ (z = 4 \text{ because } 10 \times 2 = 4 \times 5)$
 - $2 \ div \ 3 = 2/3 = 0.6666.... (z \ does \ not \ exist)$

The floating-point numbers theory is more suitable than the basic integers of Event-B.

OUTLINE

- The context of the work
- The motivating example
- The proposed approach
- Revisiting the motivating example
- Conclusion and future works

Back to the begin - Back to the outline

CONCLUSION

• Extending the Event-B type-checking system by an approach using the theory plugin.

CONCLUSION

- Extending the Event-B type-checking system by an approach using the theory plugin.
- Development of a floating point number theory formalising floating point numbers.
 - an extension of the Event-B power operator.
 - an abstract representation of the floating-point numbers.
 - a set of theorems and associated rewrite and inference rules.

FUTURE WORKS

 Refining the proposed theory to any more concrete implementation (the IEEE standard 754, for example).

FUTURE WORKS

- Refining the proposed theory to any more concrete implementation (the IEEE standard 754, for example).
- Developing a more general theory formalising the standard units of measurement defined by the International System of Units (SI).
 - extends the floating point number theory.
 - helpful in modelling cyber-physical/hybrid systems.

THANK YOU
