# PROPOSITIONAL LINEAR TEMPORAL LOGIC (LTL)

# DERIVED TEMPORAL OPERATORS

## **EXAMPLE OF TEMPORAL PROPERTIES**

#### Safety

#### • Liveness

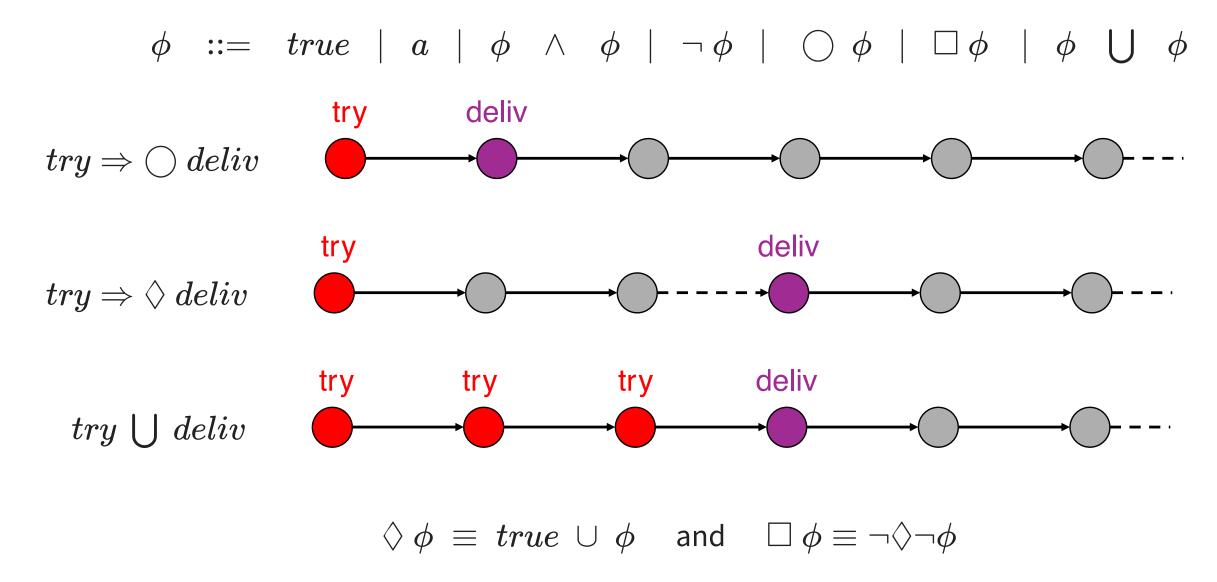

- progress :  $\Diamond progress$  response :  $\Box (try\_to\_send \Rightarrow \Diamond delivered)$
- termination :  $\Diamond \Box \ terminated$

## **EXAMPLE OF TEMPORAL PROPERTIES**

- Safety
  - cooling:
  - alarm:
  - saving:
- Liveness
  - reactivity:
  - temperature:

- nuclear plant
- $\Box \neg (temp_{high} \land cooling_{low})$ 
  - $\Box(temp_{high} \Rightarrow alarm)$
- $\Box(temp_{high}\Rightarrow\bigcirc react_{low})$ 
  - nuclear plant
  - $\Box \Diamond \ react_{high}$
  - $\Box(react_{low}\Rightarrow \Diamond temp_{low})$

# PROPERTIES OF A TRACE

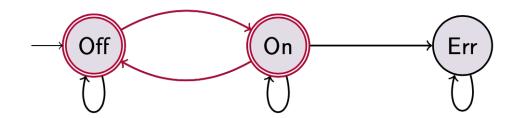

have a path  $\pi = Off On Err Err Err ... = Off On Err^{\omega}$ 

- $\pi \models \mathsf{Off}$  but  $\pi \not\models \mathsf{On}$  so  $\pi \models \neg \mathsf{On}$

- $\pi \models \bigcirc$  On
- $\pi \models \bigcirc \bigcirc \mathsf{Err}$
- $\pi \models (\mathsf{Off} \lor \mathsf{On}) \cup \mathsf{Err}$
- $\pi \models \Box (Err \Rightarrow \bigcirc Err)$
- $\pi \vDash \Box (\operatorname{Err} \Rightarrow \Box \operatorname{Err})$
- $\pi \models \Diamond \Box$  Err (persistence)
- $\pi \models \bigcirc \bigcirc \square$  Err

### PROPERTIES OF A TRACE

have a path  $\pi = \mathsf{Off}\,\mathsf{On}\,\mathsf{Off}\,\mathsf{On}\,\mathsf{Off}\,\ldots = (\mathsf{Off}\,\mathsf{On})^\omega$ 

- $\pi \nvDash (\mathsf{Off} \vee \mathsf{On}) \cup \mathsf{Err}$
- $\pi \vDash \Diamond \operatorname{Err} \Rightarrow ((\operatorname{Off} \vee \operatorname{On}) \cup \operatorname{Err})$  as  $\pi \nvDash \Diamond \operatorname{Err}$
- $\pi \vDash \Box (\mathsf{On} \lor \mathsf{Off})$
- $\pi \models \Box \Diamond \text{ On } \land \Box \Diamond \text{ Off}$  (infinitely many)
- $\pi \nvDash \Diamond \Box$  On  $\lor \Diamond \Box$  Off (persistence)
- $\pi \vDash \Box$  (Off  $\Rightarrow$   $\bigcirc$  On)  $\land \Box$  (On  $\Rightarrow$   $\bigcirc$  Off)

# LINEAR TIME PROPERTY

- Linear-Time properties specify the admissible behaviour of the system under consideration
  - ullet LT-property specifies the traces that a TS can exhibit

#### **Formal definition**

- A Linear Time Property P over AP is a subset of  $(2^{AP})^{\omega}$
- TS satisfies P (over AP):

$$TS \vDash P$$
 if and only if

$$\circ \ TS Dash P$$
 if and only if  $Traces(TS) \subseteq P \subseteq (2^{AP})^{\omega}$ 

ullet We will use the Linear Time Logic (LTL) to formalize P

# LTL SEMANTICS (RECALL)

- $\bullet \ \phi \ ::= \ true \ | \ a \ | \ \phi_1 \ \land \ \phi_2 \ | \ \neg \phi \ | \ \bigcirc \phi \ | \ \Box \phi \ | \ \lozenge \phi \ | \ \phi_1 \ \bigcup \ \phi_2$
- for  $\sigma = A_0 A_1 A_2 \cdots \in (2^{AP})^\omega$  :

```
\begin{array}{lll} \sigma \vDash true \\ \sigma \vDash a & \text{iff} & a \in A_0 \\ \sigma \vDash \phi_1 \land \phi_2 & \text{iff} & \sigma \vDash \phi_1 \text{ and } \sigma \vDash \phi_2 \\ \sigma \vDash \neg \phi & \text{iff} & \sigma \nvDash \phi \\ \sigma \vDash \bigcirc \phi & \text{iff} & A_1 A_2 A_3 \cdots \vDash \phi \\ \sigma \vDash \bigcirc \phi & \text{iff} & \forall i \geq 0, \ A_i A_{i+1} A_{i+2} \cdots \vDash \phi \\ \sigma \vDash \Diamond \phi & \text{iff} & \exists i \geq 0, \ A_i A_{i+1} A_{i+2} \cdots \vDash \phi \\ \sigma \vDash \phi_1 \bigcup \phi_2 & \text{iff} & \exists j \geq 0, \ A_j A_{j+1} A_{j+2} \cdots \vDash \phi_2 \text{ and } \\ \forall 0 \leq i < j, \ A_i A_{i+1} A_{i+2} \cdots \vDash \phi_1 \end{array}
```

# **HOW TO SPECIFY MUTUAL EXCLUSION?**

#### **Mutual Exclusion**

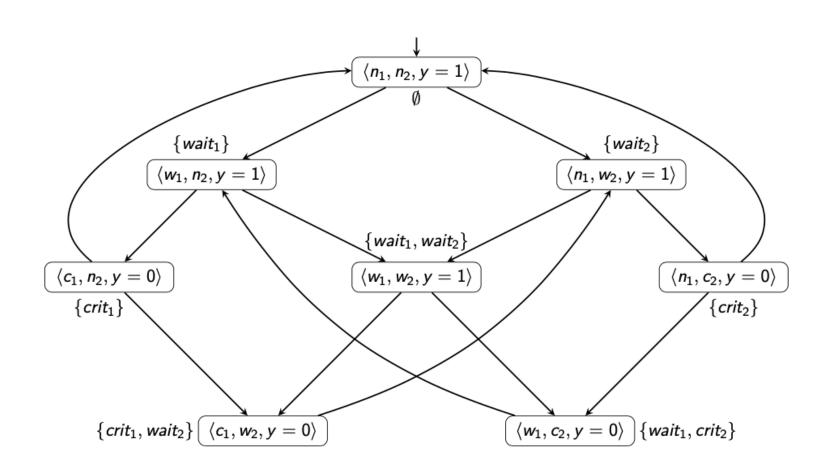

There is at most one process in the critical section

- Let  $AP = \{crit_1, crit_2\}$ 
  - other atomic propositions are not of any relevance for this property
- LTL formalization of the LT property

$$P_{mutex} = \Box \lnot (crit_1 \land crit_2)$$

ullet Does the semaphore-based algorithm satisfy  $P_{mutex}$  ?

# DOES SEMAPHORE-BASED ALGORITHM SATISFY $P_{MUIEX}$ ?

**YES!** as there is no reachable state labeled with  $\{crit_1, crit_2\}$ 

# **HOW TO SPECIFY STARVATION FREEDOM?**

#### **Starvation Freedom**

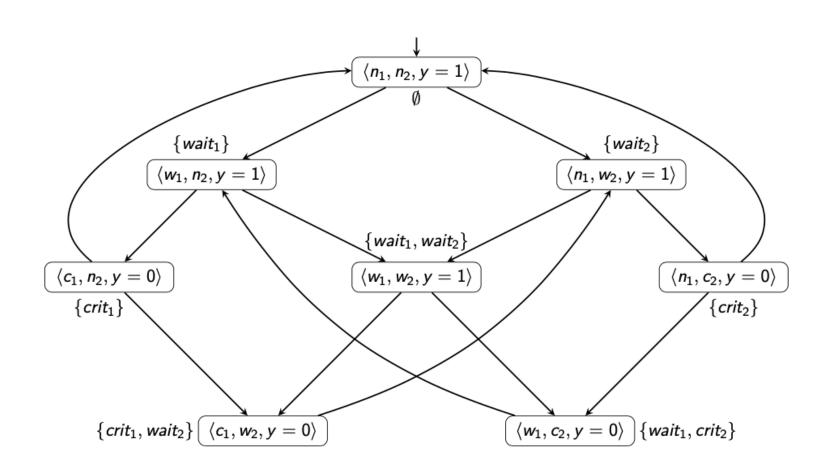

A process that wants to enter the critical section is eventually able to do so

- Let  $AP = \{wait_1, crit_1, wait_2, crit_2\}$
- LTL formalization of the LT property

$$P_{nostarve} = \square \ (wait_1 \Rightarrow \lozenge \ crit_1) \wedge \square \ (wait_2 \Rightarrow \lozenge \ crit_2)$$

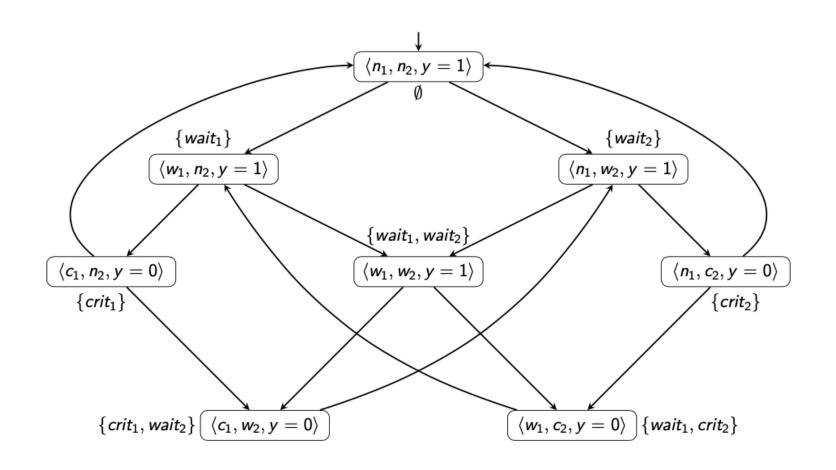

• Does the semaphore-based algorithm satisfy  $P_{nostarve}$  ?

# DOES SEMAPHORE-BASED ALGORITHM SATISFY $P_{N\!O\!ST\!AR\!V\!E}$ ?

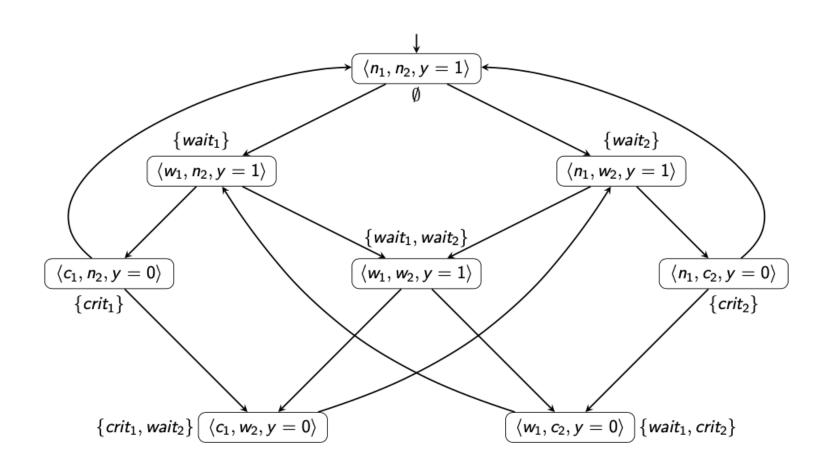

NO! process one or process two may starve!

## **PROCESS ONE STARVES**

 $\begin{array}{ll} \mathrm{let} & \sigma = \emptyset(\{wait_1\}\{wait_1, wait_2\}\{wait_1, crit_2\})^\omega \in Traces(TS) \\ & \sigma \vDash \Diamond(wait_1 \wedge \Box \neg \ crit_1) \Rightarrow \sigma \not \in P_{nostarve} \end{array}$ 

# **PROCESS TWO STARVES**

 $\begin{array}{ll} \mathrm{let} & \sigma = \emptyset(\{wait_2\}\{wait_1, wait_2\}\{crit_1, wait_2\})^\omega \in Traces(TS) \\ & \sigma \vDash \Diamond(wait_2 \wedge \Box \neg \ crit_2) \Rightarrow \sigma \not \in P_{nostarve} \end{array}$ 

## **INVARIANTS**

- Typical safety property: mutual exclusion property
  - the **bad thing** (having > 1 process in the critical section) **never occurs**
- Another typical safety property verifies variable bounds (overflow)

These properties are **Invariants** 

- An **Invariant** is an LT property
  - lacktriangle that is given by a **condition**  $\phi$  over AP
  - requires that **condition**  $\phi$  holds **for all states** (reachable ones)
  - lacktriangledown e.g. for mutual exclusion property  $\phi = \neg(crit_1 \land crit_2)$

# FORMAL DEFINITION

• An LT property  $P_{inv}$  over AP is an **Invariant** if there is a pure propositional formula  $\phi$  over AP such that:

$$P_{inv} = \Box \phi$$

- lacksquare is called an invariant condition of  $P_{inv}$
- Note that:

$$TS \models P_{inv}$$
 if and only if  $orall s \in Reach(TS), \; \mathcal{L}(s) dash_{prop} \phi$ 

•  $\phi$  has to be fulfilled by all initial states and satisfaction of  $\phi$  is invariant under all transitions in the reachable fragment of TS

# SAFETY PROPERTIES

- Safety properties: "nothing bad should happen"
  - an Invariant property is a particular safety property
- Safety properties may impose requirements on finite path fragments and cannot be verified by only considering the reachable states
- A safety property which is not an invariant
  - consider a cash dispenser
  - property "money can only be withdrawn once a correct PIN has been provided"
  - not an invariant, since it is not a state property
- a typical LTL example: Bounded Response

$$\Box(request\Rightarrowigvee_{i=n}^{m}\bigcirc^{i}response)$$

# LIVENESS PROPERTIES

- Safety properties specify that "something bad never happens"
- Doing nothing easily fulfills a safety property
  - as this will never lead to a "bad" situation
- Safety properties are complemented by Liveness properties
  - that require some progress
  - that assert: "something good" will happen eventually
- a typical LTL example:  $\Diamond \phi$

# **EXAMPLES OF LIVENESS**

Back to our semaphore-based algorithm with

$$AP = \{wait_1, crit_1, wait_2, crit_2\}$$

• Eventually

$$\Diamond \ crit_1 \wedge \Diamond \ crit_2$$

Repeated eventually

$$\Box \Diamond \ crit_1 \wedge \Box \Diamond \ crit_2$$

• Starvation freedom

$$\square (wait_1 \Rightarrow \lozenge crit_1) \wedge \square (wait_2 \Rightarrow \lozenge crit_2)$$
